

ABSTRACT

A workstation that has one or more computers located in a leg(s) of the station. The workstation may have a plurality of monitors that extend from a table top. The table top is supported by the legs of the station. The monitors can be coupled to corresponding computers located within the table legs. Each computer may be plugged into a backplane mounted to the leg(s). The backplane can be coupled to one or more external networks. One of the legs may also contain a router that is coupled to the network(s) by a single cable. The router transmits information to and between the computers of the workstation. Having a single cable reduces the complexity and cost of installing the workstation in a building structure. Locating the computers within the legs reduces the profile and decreases the corresponding floor space required for the station.
